

Information topic	Details
Indicator name	Nitrogen dioxide 1-hour maximum levels at monitoring stations
Domain and topic	Air quality: Other air pollutants
Indicator definition and units	Maximum 1-hour levels of nitrogen dioxide at monitored sites. Exceedances occur when 1-hour mean concentrations of nitrogen dioxide are above the national short-term standard (Ministry for the Environment 2014) of 200µg/m ³ (nine exceedances per 12-month period allowed)
Data source	<ul style="list-style-type: none"> - Ministry for the Environment - Statistics New Zealand
Time period and time scale	Annual; from 2005 onward
Spatial coverage	All sites that were reported by Ministry for the Environment and Statistics New Zealand
Measures of frequency	Maximum 1-hour nitrogen dioxide levels at monitored sites: <i>currently not reported, as exceedances are very rare</i>
Limitations of indicator	<ul style="list-style-type: none"> - Only sites that have nitrogen dioxide concentration monitored will be reported. - The population coverage of the monitoring sites is unknown, meaning a national representative level cannot be compiled.
Limitations of data source	<ul style="list-style-type: none"> - Not all monitoring sites have data for the whole time series - Some of the monitoring occurs at locations expected to have the highest concentrations (e.g. close to road traffic)
Related indicators	<ul style="list-style-type: none"> - Annual average PM₁₀ levels at monitoring stations - Exceedances of the daily national standard for PM₁₀, including maximum PM₁₀ levels - Monitoring sites exceeding the WHO daily guideline for sulphur dioxide - Sulphur dioxide 1-hour maximum levels at monitored sites - Carbon monoxide 8-hour maximum levels at monitored sites - Number of motor vehicles in New Zealand, by type (including diesel) - Number of light vehicles per 1000 population - Average age of vehicle fleet
Created by	Ministry for the Environment and Statistics New Zealand
