

Information topic	Details
Indicator name	Exceedances of WHO and NESAQ Nitrogen Dioxide limits
Domain and topic	Air Quality: Nitrogen Dioxide
Indicator definition and units	<p>Number of monitored sites that exceeded</p> <ol style="list-style-type: none"> 1. The WHO annual average guideline for nitrogen dioxide: exceedances occur when annual average concentrations are greater than 10µg/m³ (WHO 2021). 2. The WHO daily average guideline, where average concentrations exceed 25µg/m³ (WHO 2021). 3. The NESAQ hourly average threshold, where average concentrations exceed 200µg/m³ (Stats NZ & MfE 2021)
Data source	Ministry for the Environment and Stats NZ. <i>Our Air</i> (annual reports)
Numerator	Number of sites exceeding guidance values or national standards.
Denominator	Nil
Methodology	<p>Daily & Annual Average Calculation</p> <p>Raw data is received in the form of hourly measurements, and annual & daily average values are calculated using these as a base.</p> <ul style="list-style-type: none"> • Daily Average values are determined based on the average of the hourly recordings for a given day – only if sufficient data for that day is available (see below). • Average annual values are calculated based on the average value of all the hourly recordings in a given year. • Averages are not calculated where the day/year in question is ‘incomplete’ i.e. it lacks sufficient data for the calculation (see below). • Averages are not adjusted for the number of hours used to calculate them, i.e. an annual average based on 8,760 hourly measurement (100% of all annual hours) would be treated equally to one based on 6,570 measurements (75%). <p>Data Validity Check</p> <p>In the calculation of daily/annual average values, a check to make sure the data meets the 75% completion requirement (Ministry for the Environment and Stats NZ. 2021) is made.</p> <ul style="list-style-type: none"> • A day must have at least 18 hours of data to be ‘complete’. • A year must have at least 6,570 hours of data (6588 hours in the case of leap years) to be ‘complete’. This is equivalent to 274 complete days (275 in leap years) • NO₂ concentrations and numbers of exceedances are not calculated or reported for incomplete days & years.

Metadata

Time period and time scale	Annual, 2005 onwards
Population coverage	Nil
Spatial Coverage	All sites with valid data that were reported by the Ministry for the Environment and Stats NZ. Validity of data is discussed in the 'methodology' section above.
Measures of frequency	Number of exceedances of the relevant air quality limit/guideline value per year
Limitations of indicator	<ul style="list-style-type: none"> The population coverage of the monitoring site is unknown, meaning a national representative average cannot be applied.
Limitations of data source	<ul style="list-style-type: none"> Monitoring information is only reported if the site achieves greater than 75% valid data collection and data were present for at least three consecutive years. Monitoring site data is only applicable a small area around the site – a single station is not representative of a whole city, let alone a full region The small (<20) number of sites further reduces the spatial coverage of the data Some of the monitoring occurs at peak sites (sites expected to have high concentrations e.g. where home heating emissions accumulate, close to high-volume road traffic or near industrial activities). These sites may therefore not be representative of the surrounding area.
Related indicators	<ul style="list-style-type: none"> Monitoring sites exceeding the national environmental standard (one-hour average) for sulphur dioxide Monitoring sites exceeding the WHO daily guideline for sulphur dioxide Carbon monoxide 8-hour maximum levels at monitored sites
